Session – 6

Task-1.

Write an SQL query to display all products from a 'products' table and sort them by price in ascending order, similar to how Flipkart lists items from lowest to highest price.

Solution:

```
CREATE TABLE products (
   product_id INT PRIMARY KEY,
   product_name VARCHAR(100),
   category VARCHAR(50),
   price DECIMAL(10,2)
);

INSERT INTO products (product_id, product_name, category, price)
VALUES
(1, 'Laptop', 'Electronics', 55000),
(2, 'Smartphone', 'Electronics', 30000),
(3, 'Headphones', 'Accessories', 2500),
(4, 'Keyboard', 'Accessories', 1500),
(5, 'Monitor', 'Electronics', 12000),
(6, 'Smart Watch', 'Wearable', 8000),
(7, 'Tablet', 'Electronics', 25000);

SELECT *
FROM products
ORDER BY price ASC;
```

Task-2.

Modify your previous query to show the top 5 most expensive products using ORDER BY with DESC and LIMIT.

Solution:

```
SELECT *
FROM products
ORDER BY price DESC
```

LIMIT 5;

Task-3.

Given a 'movies' table with columns 'title', 'release_year', and 'rating', write an SQL query to list all movies sorted first by release_year in descending order (latest first), then by rating in descending order (highest rated first).

Solution:

SELECT title, release_year, rating

FROM movies

ORDER BY release_year DESC, rating DESC;

Task-4.

Write an SQL query to display the first 10 restaurants from a 'restaurants' table, sorted alphabetically by name, just like Zomato's A-Z listing.

Hint: Use ORDER BY with LIMIT.

Solution:

SELECT *

FROM restaurants

ORDER BY name ASC

LIMIT 10;

Task-5.

Suppose you want to display the top 3 trending songs from a 'songs' table based on play_count, but if two songs have the same play_count, the more recently added song should come first. Write the SQL query to achieve this.

Hint: Use ORDER BY with multiple columns.

Solution:

SELECT *

FROM songs

ORDER BY play_count DESC, added_date DESC

LIMIT 3;
