Session – 4

Task-1.

Given the daily order counts for a Swiggy delivery partner over 10 days: [12, 15, 17, 14, 13, 16, 200, 18, 14, 15], plot a simple graph (hand-drawn or using any tool) and describe whether the data is left skewed, right skewed, or symmetrical. Explain your reasoning based on the shape.

Solution:

Data:

[12, 15, 17, 14, 13, 16, 200, 18, 14, 15]

The graph shows that most days have orders between **12 and 18**, but Day 7 has an extremely high value of **200**.

Answer: Right-skewed (positively skewed).

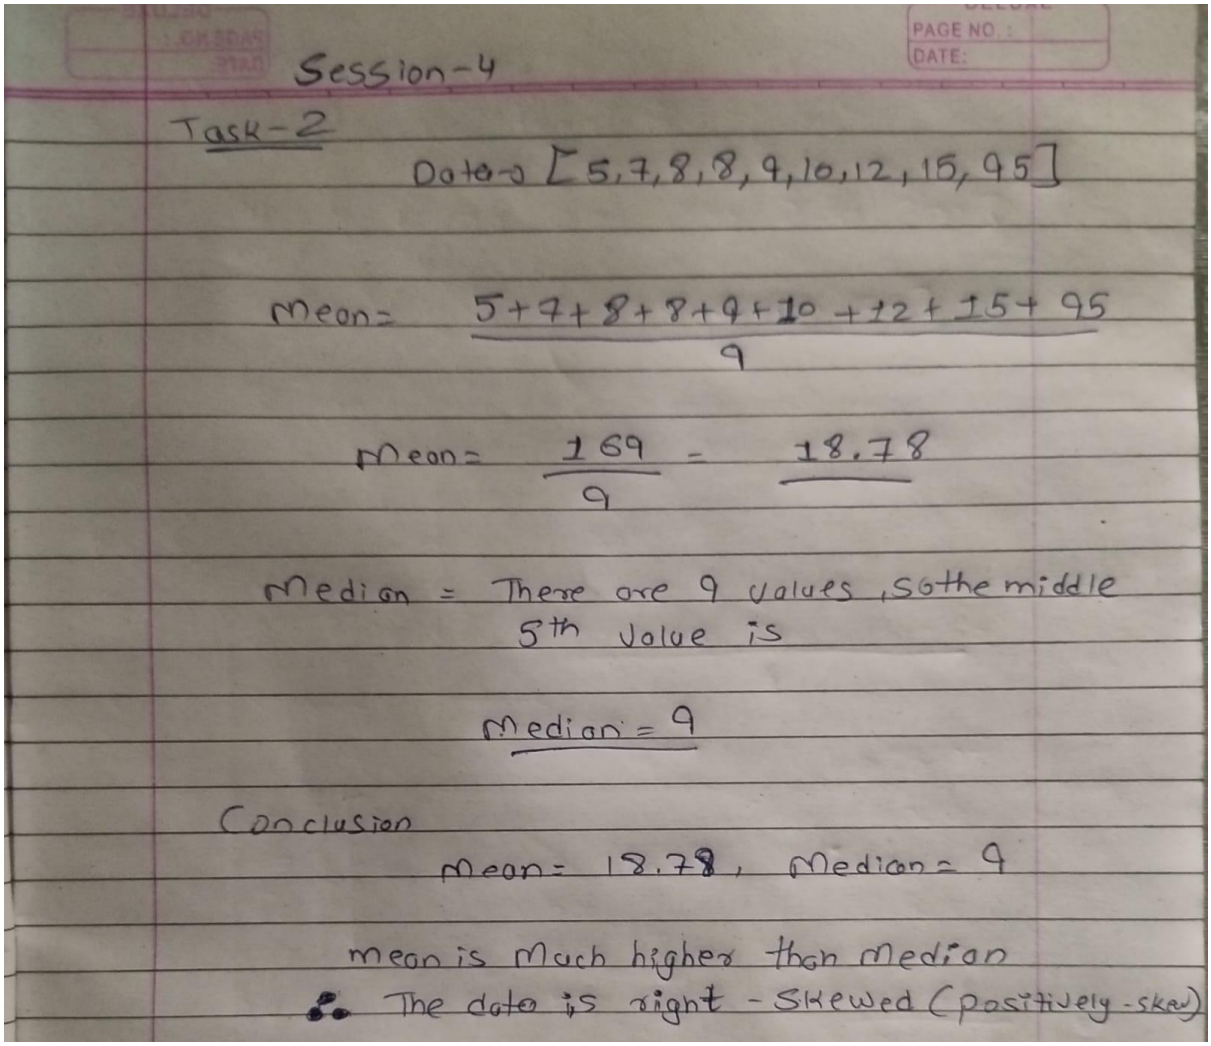

Reason: The extreme value of 200 creates a long tail toward the **right**, pulling the mean higher than the median.

Task-2.

Take the following list of Instagram influencer follower counts (in thousands): [5, 7, 8, 8, 9, 10, 12, 15, 95]. Calculate the mean and median, then state which is higher and what that tells you about the skewness of the data.

Hint: If the mean is pulled away from the median, the data is skewed in that direction.

Solution:

Task-3.

Find a real-world example of right-skewed data from any app you use (like Zomato order amounts, Paytm wallet balances, or YouTube video views). Briefly describe the dataset and explain why you think it is right skewed.

Solution:

YouTube Video Views

Suppose a channel's video views are:

[1, 2, 3, 4, 5, 6, 8, 10, 500] thousand views.

Most videos receive relatively few views, while occasionally one video becomes viral and receives hundreds of thousands of views.

This creates a **long tail toward higher values**, so the data is **right-skewed**. This is common with video views because a small number of viral videos can have dramatically more views than typical videos.

Task-4.

Given this dataset of Flipkart product ratings: [3, 3, 4, 4, 4, 5, 5, 5, 5, 5], draw a rough graph and state if the distribution is symmetrical, left skewed, or right skewed. Justify your answer in one line.

Solution:

Data:

[3, 3, 4, 4, 4, 5, 5, 5, 5, 5]

Frequency:

Rating	Frequency
3	2
4	3
5	5

The graph shows that the frequency increases as we move toward **5**, while the smaller ratings form the tail on the **left**.

Answer: Left-skewed (negatively skewed).

Justification: Most ratings are high (4–5), with fewer low ratings (3), creating a longer tail toward the **left**.
